
a
Atomic optimum
descriptor, intrinsic turnover
Laboratory optimum
measured activity, STY at test conditions
Industrial optimum
plant-cost leader after process optimization and economics
Ammonia atomic → industrial
Figs 1, 3, 4
CO2-to-methanol published laboratory → industrial
Figs 2, 5
Au/TiO2 CO-oxidation control Fig. 6 laboratory → catalyst requirement
TOF
EN
recycle
USD t−1
NH3(l)
Atomic descriptor
N* at the step, EN
Microkinetics
TOF at 673 K
Laboratory test
measured rate, STY
Catalyst inventory
Vbed ≤ 90 m3
Synthesis loop
T, P, Tsep reoptimized
Economics
catalyst-dependent cost
Backward design: activity multiplier α* needed for parity vs headroom reachable on the scaling line
b
Decision-frontier candidates
Ru
EN = −1.13 eV
USD 53,853 kg−1
#1 → #2
Os
EN = −1.11 eV
USD 142,650 kg−1
#2 → #3
Fe
EN = −1.39 eV
USD 8 kg−1
#3 → #1
atomic rank → economic rank
